Electronic data management and patient registration

Registration and randomization of patients onto clinical trials occurs at CRAB via the web. CRAB uses electronic data capture software that facilitates the real time data management of Phase I, II and III studies. All data entry, from registration through follow-up, is done via these systems. Data submission is done by Study Coordinators at their site. Automatic edit checks limit errors and forms can not be submitted if incomplete. An online user manual presents step-by-step logical sequences of instruction.

Real time data review by the study team is made easy by direct access to individual and aggregate patient information. This state of the art online system greatly simplifies the conduct of clinical trials and reduces the overall time needed to complete studies.
